

# Grow Kit

TERRACOTTA PLANTER

## INCLUDES

COCO POT  
GROW MEDIUM  
WICK  
PLANTER

 SEEDS  
 COCO DISC  
 CARBON  
 PLANT FOOD

Consider the time of year and your region's climate before starting this kit. Herbs thrive in temps between 65°F-70°F and with at least 6 hours of direct sunlight (an unobstructed south or west-facing window is best). Starting in Mar-Sept will provide longer days and thus optimal light. If starting during cooler months, consider supplementing with a grow light.

## Getting Started

1. Wash hands and remove all contents from the planter. **(Starting with clean hands prevents potential mold growth.)**
2. Pour 1 cup of water into the planter. Don't overfill — water shouldn't touch the coco pot.
3. Turn the coco pot upside down and using a sharp knife, cut two parallel slots about 1" apart.
4. Flip the coco pot so it faces upright and thread the wick upwards through the first slot and down through the second to create a loop.
5. Pull the wick loop up so that it's ½" below the top of the planter.
6. Hold the wick loop upright while you pour the grow medium through and around the wick in the coco pot. Fill to ½" below the top of the planter. Under a faucet, slowly run warm water over the grow medium for 30 seconds.
7. Place the coco disc on top of the grow medium and sprinkle with water until disc is fully expanded. Gently spread the coco on top of the grow medium and pour the carbon evenly over the coco.
8. Insert the coco pot back into the planter.
9. Sprinkle on the seeds and push them just below the surface of the grow medium.

OVER >

10. Place in a warm and sunny window. Until sprouts pop, check the coco daily and make sure it's slightly damp. If not, spray with a little water.
11. Once sprouts develop, empty the water from the planter. Dissolve 1/8 tsp plant food in 1 cup water. Pour 1/2 cup directly thru the coco pot, carefully around sprouts. Remove the coco pot and pour the remaining solution directly into the planter.
12. Occasionally lift the coco pot to determine if the planter needs a refill. If so, repeat step 10.

## Growing on

Some seeds may fail to germinate (this is nature). If sprouts don't appear in 4-5 weeks, the seeds may have been planted too deep, growing medium is too dry or too wet, or temps are too low.

If the coco develops mold then it is too wet. Gently remove mold and move the planter to a dry, well-ventilated location with direct sunlight.

If sprouts appear weak and spindly, there is either not enough light or temps are not in the optimal range. Try a different location or consider supplementing with a grow light. During the outdoor growing season you can place the planter outside, just make sure the planter doesn't flood.

If temps outside drop below 55°F, remove planter from window to prevent cold damage.

If roots grow through the coco pot and into the planter, you should change water and plant food mixture every 2-3 weeks.

The coco pot can be planted directly into a planter or the ground when the plant begins to outgrow the kit.

---

Your Terracotta Planter is designed to be reused! To grow something new, rinse the planter, add potting soil and new seeds, spritz with water and set in a sunny window. You can also transplant a 2" or 4" potted plant into the planter.
